

## Our operating context

We execute our strategy within the context of broad interconnected trends: long-term structural trends, which have contributed to Africa's strong growth over the past two decades; and cyclical trends, which are short to medium term in nature and will change over time.

Our strategy is intentionally designed to realise the opportunities presented by the structural trends, while retaining the flexibility needed to respond effectively to the cyclical trends.

## Cyclical trends

### Falling commodity prices and slowing exports to China

Several of our operating countries have felt the impact of falling commodity prices – which are at multi-year lows – and the slowing down of exports to China. Countries reliant on single commodity exports such as oil and copper are most vulnerable. Falling commodity prices have also contributed to currency volatility in these countries.

Given the reliance of many African countries on exports to China, even a small slowdown in China's growth can have a disproportionate domestic impact, which filters through the economic value chain to individual consumers.

### Socio-political pressure

Falling commodity prices together with the drought conditions in sub-Saharan Africa have increased the risk of rising food prices and food shortages. Higher inflation, currency depreciation and job losses, particularly in the mining and agriculture sectors, together with cutbacks in government spending, could give rise to social discontent and associated protest action. In East and West Africa, civil conflict and terrorist activity remain a concern.

### Rising interest rates in the United States (US)

Consensus is that the US Federal Reserve Bank will continue to gradually increase interest rates in 2016, slowing currency inflows to emerging markets and increasing the burden on countries with dollar-denominated debt. This is likely to lead to increases in South African domestic interest rates.

### Impact on the South African economy

South Africa is facing challenging economic conditions, with downward revisions in growth forecasts driven by cyclical trends. Together with the sharp weakening in the domestic currency and a growing current account deficit, the risk of the country's credit rating being downgraded further remains high.

The impact of cyclical trends on society, in the form of higher inflation in the price of goods and services and a potential increase in unemployment, creates the risk of social instability. Encouragingly these conditions are driving a renewed commitment between the public and private sectors to practically address South Africa's socioeconomic challenges.
